

# LINEAR ALGEBRA

STRANG, SECTION 1.1

## 1. THE ASSIGNMENT

- Read section 1.1 of Strang (pages 1-7).
- (Optional) read Hefferon Chapter One, Part II Linear Geometry, section 1 (pages 32-37).
- Read the following and complete the exercises below.

## 2. VECTORS AND LINEAR COMBINATIONS

Algebraically, a *vector* is a stack of numbers in a set of parentheses or brackets, like this

$$\begin{pmatrix} 2 \\ 7 \\ 9 \end{pmatrix}, \text{ or } \begin{bmatrix} 2 \\ 7 \\ 9 \end{bmatrix}, \text{ or } (2 \ 7 \ 9).$$

The individual numbers are called the *components* or *entries* or *coordinates* of the vector. For example, 7 is the second component of the vectors above.

The first two vectors above are called *column* vectors because they are stacked vertically. The third is called a *row* vector because it is arranged horizontally. For this class, we will always use column vectors, but to save space, we might sometimes write them as row vectors. It is up to you to make the switch. (We will see later how this matters!)

Vectors can take lots of different sizes. The vectors above are all 3-vectors. Here is a 2-vector:

$$\begin{pmatrix} 71 \\ -12 \end{pmatrix}.$$

Here is a 4-vector:

$$\begin{pmatrix} \pi \\ 0 \\ -\pi \\ 1 \end{pmatrix}.$$

The main value in using vectors lies in their standard interpretations. Let's focus on 3-vectors for now. The vector  $\begin{pmatrix} x \\ y \\ z \end{pmatrix}$  can represent

- A point in space described in the standard three-dimensional rectangular coordinate system with  $x$  coordinate equal to  $a$ ,  $y$ -coordinate equal to  $b$  and  $z$  coordinate equal to  $c$ .
- An arrow in space which points from the \*origin\*  $(0, 0, 0)$  to the point  $(a, b, c)$ .
- An arrow in space which points from some point  $(x, y, z)$  to the point  $(x + a, y + b, z + c)$ .

**2.1. Operations on Vectors.** There are two operations on vectors which are of utmost importance for linear algebra. (In fact, if your problem has these operations in it, there is a chance you are doing linear algebra already.)

**2.1.1. Scalar Multiplication.** Given a number  $\lambda \in \mathbb{R}$  and a vector  $v = \begin{pmatrix} a \\ b \\ c \end{pmatrix}$ , we form the new vector

$$\lambda v = \begin{pmatrix} \lambda a \\ \lambda b \\ \lambda c \end{pmatrix}.$$

**2.1.2. Addition.** Given a vector  $v = \begin{pmatrix} a \\ b \\ c \end{pmatrix}$  and a vector  $w = \begin{pmatrix} d \\ e \\ f \end{pmatrix}$  of the same size, we form their *sum*

$$v + w = \begin{pmatrix} a+d \\ b+e \\ c+f \end{pmatrix}$$

These operations have “obvious” generalizations to vectors of different sizes. Because things go entry-by-entry, these are often called *coordinate-wise* operations.

Combining these two operations gives us the notion of a *linear combination*. If  $\lambda$  and  $\mu$  are numbers and  $v$  and  $w$  are vectors of a common size, then the vector

$$\lambda v + \mu w$$

is a linear combination of  $v$  and  $w$ .

### 3. SAGE INSTRUCTIONS

I have made a Sage worksheet file with some basic commands that you might find useful in investigating vectors. The file is called *section1-1.sagews*. It also has some interactive demonstrations about how to deal with vectors.

### 4. QUESTIONS FOR SECTION 1.1

**Exercise 1.** Find an example of numbers  $\lambda$  and  $\mu$  so that

$$\lambda \begin{pmatrix} 1 \\ 2 \end{pmatrix} = \mu \begin{pmatrix} 2 \\ -1 \end{pmatrix}$$

or describe why no such example can exist.

**Exercise 2.** Find a vector  $b = \begin{pmatrix} b_1 \\ b_2 \end{pmatrix}$  so that

$$\begin{pmatrix} 2 \\ 7 \end{pmatrix} + \begin{pmatrix} b_1 \\ b_2 \end{pmatrix} = \begin{pmatrix} 10 \\ -3 \end{pmatrix}$$

or describe why no such example can exist.

**Exercise 3.** Find a vector  $b = \begin{pmatrix} b_1 \\ b_2 \end{pmatrix}$  so that this equation has at least one solution  $\lambda$

$$\begin{pmatrix} 1 \\ -2 \end{pmatrix} + \lambda \begin{pmatrix} b_1 \\ b_2 \end{pmatrix} = \begin{pmatrix} 2 \\ 3 \end{pmatrix}$$

or describe why no such example can exist.

**Exercise 4.** Give examples of numbers  $a$  and  $b$  such that

$$a \begin{pmatrix} 2 \\ 1 \end{pmatrix} + b \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \begin{pmatrix} 7 \\ 5 \end{pmatrix}$$

or explain why no such numbers exist.

In the situations like the last exercise, the pair of numbers  $a, b$  is called a *solution* to the equation.

**Exercise 5.** Give an example of a vector  $X = \begin{pmatrix} x \\ y \end{pmatrix}$  so that the equation

$$a \begin{pmatrix} 2 \\ 1 \end{pmatrix} + bX = \begin{pmatrix} 7 \\ 5 \end{pmatrix}$$

has no solution  $(a, b)$ , or explain why no such example exists.

**Exercise 6.** Give an example of a number  $\lambda$  so that

$$\lambda \begin{pmatrix} 7 \\ -1 \\ 2 \end{pmatrix} + 3 \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 49 \\ -7 \\ 20 \end{pmatrix}$$

or explain why no such number exists.

**Exercise 7.** Give an example of numbers  $\lambda$  and  $\mu$  which are a solution to the equation

$$\lambda \begin{pmatrix} 7 \\ -1 \\ 2 \end{pmatrix} + \mu \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 49 \\ -7 \\ 20 \end{pmatrix}$$

or explain why no such solution exists.

**Exercise 8.** Give an example of a vector  $w = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  so that the equation

$$a \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} + b \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

has no solution  $(a, b)$ , or explain why no such vector exists.

**Exercise 9.** Give an example of a vector  $w = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  so that the equation

$$a \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} + b \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

has exactly one solution  $(a, b)$ , or explain why no such vector exists.

**Exercise 10.** Give an example of a vector  $X = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  such that the equation

$$a \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} + b \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} + c \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

has no solutions  $(a, b, c)$ , or explain why no such vector exists.

**Exercise 11.** Give an example of a vector  $X = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  such that the equation

$$a \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} + b \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} + c \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

has exactly one solution, or explain why no such vector exists.

**Exercise 12.** Give an example of a vector  $X = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  such that the equation

$$a \begin{pmatrix} 1 \\ 0 \\ 2 \end{pmatrix} + b \begin{pmatrix} 0 \\ -1 \\ 0 \end{pmatrix} + c \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 3 \\ 7 \\ 7 \end{pmatrix}$$

has no solutions, or explain why no such vector exists.
